

DR 09-0045 — WML, Fonts: Character encodings of font names

Proposed Solution

Agreed; the following updates should be made to §17.8.3.1:

When an application cannot locate a font using the primary name stored on the font attribute of the font element (**\$Error! Reference source not found.**), it should use each alternate name in term to attempt to locate the font, and use the first font for which is locates a match.

Font names stored using this element shall be specified in the encoding specified by the Fonts part in its XML declaration; the name of the font will be interpreted by the XML parser.

If this element is omitted, then no alternate names are present for the parent font.
